Chapter 11

Minimum Spanning Tree Recitation.

11.1 The Spanning Tree Problem.

Definition 11.1.1. A spanning tree T of a graph G = (V, E) is a subset of edges in E such that T is a tree (having no cycles), and the graph (V, T) is connected.

Problem 11.1.1 (MST). Let G=(V,E) be a weighted graph with weight function $w:E\to\mathbb{R}$. We extend the weight function to subsets of E by defining the weight of $X\subset E$ to be $w(X)=\sum_{e\in X}w(e)$. The minimum spanning tree (MST) of G is the spanning tree of G that has the minimal weight according to w. Note that in general, there might be more than one MST for G.

Definition 11.1.2. Let $U \subset V$. We define the cut associated with U as the set of outer edges of U, namely all the edges $(u,v) \in E$ such that $u \in U$ and $v \notin U$. We use the notation $X = (U, \bar{U})$ to represent the cut. We say that $E' \subset E$ respects the cut if $E' \cap X = \emptyset$.

Lemma 11.1.1 (The Cut-Lemma). Let T be an MST of G. Consider a forest $F \subset T$ and a cut X that respects X (i.e. $F \cap X = \emptyset$). Then $F \cup \arg\min_e w(e)$ is also contained in some MST. Note that it does not necessarily have to be the same tree T.

In the lecture, you learned about the Kruskal algorithm for finding an MST. This algorithm constructs the MST iteratively, where in each step it holds a forest F contained in the MST and then looks for the minimal edge in a cut that it respects. It is important to note that since F has no cycles, any edge $e \subset E$ that does not close a cycle in F must belong to a cut X that is respected by F. By enforcing the order of edges being examined to be increasing in weight, it follows that the first edge that does not close a cycle is also the one with the minimum weight among them. Therefore, by Lemma 11.1.1, we can conclude that the forest obtained by adding e into F is contained in the MST, and we can continue with it.

```
Result: Returns MST of given G=(V,E,w)
1 sorts the E according to w
2 define F_0=\emptyset and i\leftarrow 0
3 for e\in E in sorted order do
4 | if F_i\cup\{e\} has no cycle then
5 | F_{i+1}\leftarrow F_i\cup\{e\}
6 | i\leftarrow i+1
7 | end
8 end
9 return F_i
```

Algorithm 1: Kruskal alg.
