## 5.1

Another sorting algorithms, that it's correctness isn't so obivoius.

**Claim 5.1.1.** After the *i*th iteration,  $A_1 \leq A_2 \leq A_3 ... \leq A_i$  and  $A_i$  is the maximum of the whole array.

*Proof.* By induction on the iteration number i.

- 1. Base. For i=1, it is clear that when j reaches the position of the maximal element, an exchange will occur and  $A_1$  will be set to be the maximal element. Thus, the condition on line (3) will not be satisfied until the end of the inner loop and indeed, we have that  $A_1$  at the end of the first iteration is the maximum.
- 2. Assumption. Assume the correctness of the claim for any i' < i.
- 3. Step. Consider the ith iteration. And observe that if  $A_i = A_{i-1}$  then  $A_i$  is also the maximal element in A, namely no exchange will be made in the ith iteration, yet  $A_1 \leq A_2 \leq ... \leq A_{i-1}$  by the induction assumption, thus  $A_1 \leq A_2 \leq ... \leq A_{i-1} \leq A_i$  and  $A_i$  is the maximal element, so the claim holds in the end of the iteration. If  $A_i < A_{i-1}$  then there exists  $k \in [1, i-1]$  such that  $A_k > A_i$ . Set k to be the minimal position for which the inequality holds. For convenience, denote by  $A^{(j)}$  the array in the beginning of the jth iteration of the inner loop. And let's split into cases according to j value.

- (a) j < k By definition of k, for any j < k,  $A_j^{(1)} < A_i^{(1)}$ , Hence in the first k-1 iterations no exchange will be made and we can conclude that  $A_l^{(j)} = A_l^{(1)}$  for any  $l \in [n]$  and  $j \le k$ .
- (b)  $j \ge k$  and j < i + 1, We claim that for each such j an exchange will always occur.

**Claim 5.1.2.** For any  $j \in [k, i]$  we have that in the end of the jth iteration:

- $A_i^{(j+1)} = A_i^{(j)}$ .
- $A_i^{(j+1)} = A_i^{(j)} = A_i^{(1)}$ .
- For any l>j and  $l\neq i$  we have  $A_l^{(j+1)}=A_l^{(1)}$ .

*Proof.* Observe that the third section holds trivially by the definition of the algorithm. It doesn't touch any position greater than j in the first j iterations (inner loop) except the ith position. So we have to prove only the first two bullets. Again, we are going to prove them by induction.

- i. Base.  $A_k^{(1)}$  is greater than  $A_i$ , and by the above case, we have that at the beginning of the kth iteration  $A_k^{(k)} = A_k^{(1)}$ ,  $A_i^{(k)} = A_k^{(1)}$ . Therefore, the condition on line (3) is satisfied, an exchange is made, and  $A_k^{(k+1)} = A_i^{(k)} = A_i^{(0)}$  and  $A_i^{(k+1)} = A_k^{(k)}$ . Now,  $A_{k+1}^{(k+1)} = A_{k+1}^{(k)} = A_{k+1}^{(0)}$ .
- ii. Assumption. Assume the correctness of the claim for any  $k \ge j' < j \le i$ .
- iii. Step. Consider the  $j \in (k,i]$  iteration. By the induction assumption, we have that  $A_{j-1}^{(j)} = A_i^{(j-1)}$  and  $A_i^{(j)} = A_{j-1}^{(j-1)} = A_{j-1}^{(1)}$ . On the other hand, by the induction assumption of Claim 5.1.1,  $j-1 < i \Rightarrow A_{j-1}^{(1)} \le A_j^{(1)}$ . Combining the third bullet, we obtain that:

$$A_i^{(j)} = A_i^{(1)} \ge A_{i-1}^{(1)} = A_i^{(j)}$$

And therefore, either there is an inequality and an exchange is made or there is equality. In both cases, after the ith iteration, we have  $A_j^{(j+1)} = A_i^{(j)}$  and  $A_i^{(j+1)} = A_j^{(j)} = A_j^{(1)}$ .

(c) j>i, so we know that  $A_i^{(i+1)}$  is the maximal element in A. Therefore, for any j, it holds that  $A_i^{(i+1)} \geq A_j^{(i)}$ . It follows that no exchange would be made and  $A_i^{(j)}$  will remain the maximum until the end of the inner loop.

5.1.

```
Result: returns the multiplication x \cdot y where x, y \in \mathbb{F}_2^n
 2 if x,y \in \mathbb{F}_2 then
